Predicting YouTube Shorts View Performance
12/4/25

Dataset Description

The dataset used in this project is the YouTube Shorts Performance Dataset, which contains 300 shorts from YouTube. They contain categories like tech, food, travel, comedy, lifestyle, and education. Each entry represents a single YouTube short and includes features like the video length, number of hashtags used, the hour of the day the video was uploaded, the content category, and engagement metrics.

Scenario

Short-form video creators often struggle to understand which factors influence the exposure of their content. While platforms like YouTube provide analytics after posting, creators lack the predictive tools that help them estimate performance before publishing a video.

Target Audience

- Content creators who want to optimize the performance of their YouTube shorts.
- Social media managers working with brands or influencers.
- Digital marketers analyzing short form content trends.
- Businesses using short videos to promote products or services

Problem being addressed

Can we predict the number of views a YouTube short will receive based on its features before it is published?
